

ATS is not only useful for employers, however. It is a built-in feature on recruiting platforms and LinkedIn. The software can scan your resume for keywords and let you know when you are missing qualifications that are required according to the job description.

It will highlight the missing qualifications in red, and it will highlight the qualifications already on your resume in green. If it says you are missing a qualification that you are experienced in, this is a good time to add that skill to your resume!

The software will filter resumes and allow only qualified resumes to be delivered to the hiring manager's email inbox.

When reviewing a job description, pay close attention to the exact wording the employer uses. Even small differences in terms can affect whether your resume is recognized as a match by an Applicant Tracking System. For example, a job description might list **"Quality Control experience required."** If your resume only mentions "Quality Assurance," the ATS might not recognize that as the same skill, even though they are similar in meaning.

To make sure your resume passes through the system, use the same keywords from the job posting whenever they truthfully apply to your experience.
